Building on the successful foundation of the "Careers in My Community" program at the elementary level, Mid-East Career and Technology Centers has launched a new, STEM-focused career exploration program exclusively for Zanesville Middle School students. This targeted initiative introduces middle schoolers to high-demand technical concepts through immersive, hands-on activities centered on science, technology, engineering, and mathematics. Led by a dedicated instructor, the program helps students connect classroom learning directly to real-world industries like advanced manufacturing, robotics, and healthcare. By focusing specifically on the middle school level, Mid-East CTC bridges the gap between early career awareness and high school technical programs, keeping Zanesville students engaged and prepared for future career paths.

Slide 4

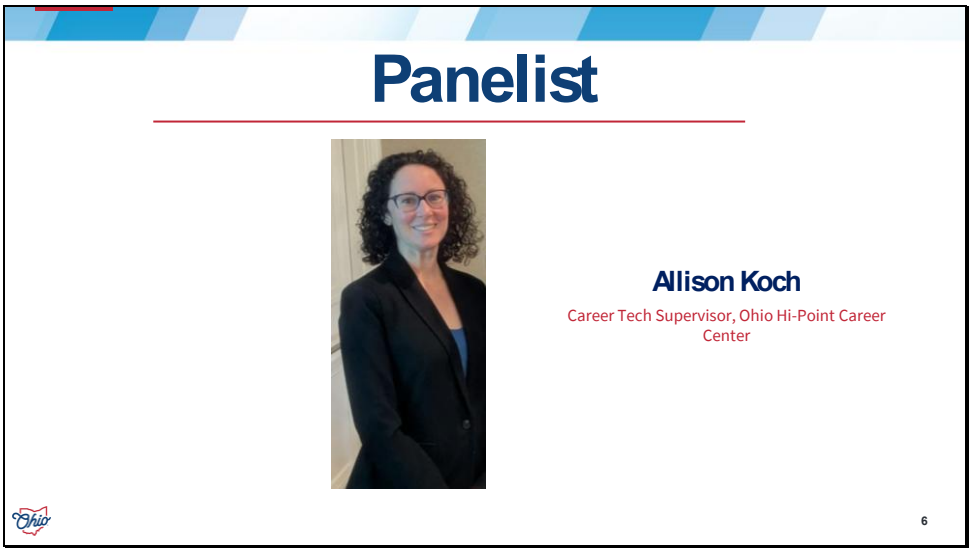

LCJVS and Avon High School's shared delivery model for Sports Health and Fitness Technologies provides students with expanded access to authentic, career-connected learning. Both districts provide a CTE instructor who delivers program coursework, with the LCJVS teacher coordinating external work-based learning and Avon's instructor connecting learning to sport-specific activities within the district. This collaborative approach broadens students' experiences, strengthens connections between classroom learning and careers, and allows students to explore opportunities that can lead into other Health Sciences pathways based on their interests.

Slide 5

Auburn Career Center recently launched a new Welding satellite program at Perry High School that represents a unique partnership among Auburn, Perry Local Schools, and Lake Erie College. Perry initially started the welding program approximately three years ago in partnership with Lake Erie College, but we began conversations about how we could collaboratively build a more sustainable model while expanding opportunities for students. Under the new partnership, Auburn maintains the CTE program and employs the welding instructor, who also serves as an adjunct faculty member for Lake Erie College. This allows College Credit Plus (CCP) coursework to be embedded directly into the high school CTE program, giving students the opportunity to simultaneously earn high school credit, industry credentials, and college credit. The financial model is also highly collaborative: because the program is now a state-recognized CTE program, it generates CTE funding that was not available under the previous structure. After those state CTE funds are applied, the remaining program costs are shared between Auburn Career Center and Lake Erie College. The partnership demonstrates how a career center, local school district, and higher education institution can combine resources rather than duplicate them, creating a more sustainable pathway that provides students with greater access to career-technical education and college credit.

Ohio Hi-Point Career Center (OHP) and Marysville Exempted Village School District have partnered to provide students with career-connected, hands-on learning for many years. OHP provides the instructor, curriculum, equipment, and supplies, while Marysville provides the students, space, and typically furniture. OHP's work-based learning coordinator helps place pathway students in internships and other career experiences.

This year, the partnership added two satellite programs identified through conversations with the community, stakeholders, and both schools. Aviation serves middle and high school students, showing them there is more to the field than piloting while preparing them for their written test. Interactive Media, offered at the middle school level, adds elective variety and was purposely placed to help build high school enrollment in our Media Arts and IT programs.

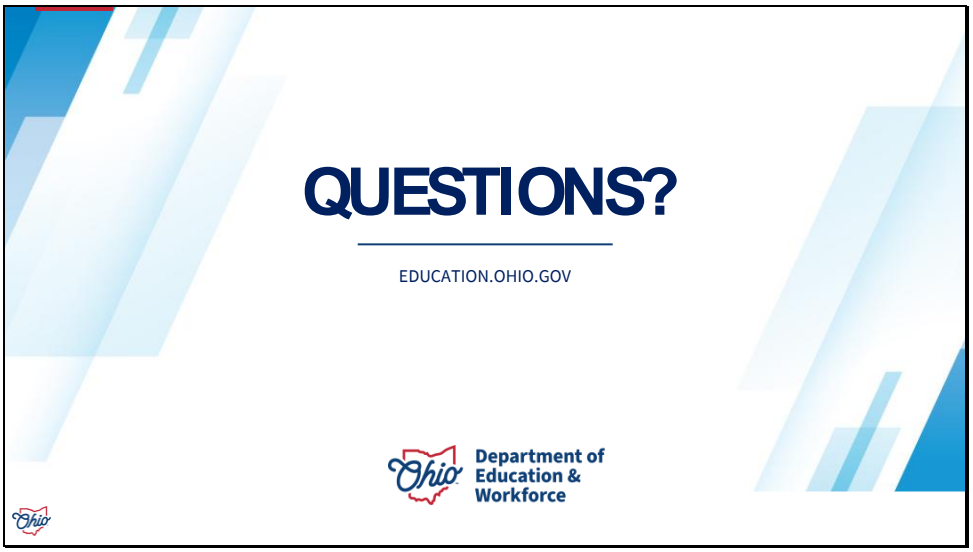

Slide 7

Warren County Career Center and Wayne Local Schools partnered to create a Family and Consumer Sciences food lab inside Waynesville High School, giving students access to career-connected learning in their home building. As the project developed, facility issues, permitting and code requirements, and the costs to overcome these made a full commercial kitchen buildout impractical for the existing space. The districts responded by re-scoping the project around equipment and modest facility upgrades that could be supported within the room.

WCCC provides the instructor, equipment, and program oversight, while Wayne Local provides the space and facilities support. The result is a lower-cost, code-compliant model for delivering a food-based program within a traditional high school setting, one WCCC believes can be replicated in other partner districts facing similar space and facility constraints.
